

Braille

Braille is a system of raised dots used by people who are blind or have low vision. It is a form of communication that allows them to read and write. The system was developed by Louis Braille, a Frenchman who became blind at a young age. He created the Braille system as a way for blind people to communicate with each other. The system is based on a 6-dot grid, and each dot represents a letter or a number. The dots are arranged in a way that allows them to be felt with the fingers. The Braille system is used in many different ways, including reading books, writing letters, and using computers. It is a very important part of the lives of many people who are blind or have low vision.
